Delray Beach City-Wide Tree Inventory
Tree Structural Values Based on ISA Trunk Formula Method

Table with columns: Tree #, Species Common Name, Species Scientific Name, Adult/Trunk?, Trunk Diameter (in) or Overall Height (ft) or Percent (%), Condition (%), Location (N), Species Rating (%), Size (caliper in inches for trees, height in feet), Price, Installed Tree Cost, Replacement Tree Trunk Area (sq. in.), Unit Tree Cost (\$/sq. in. or \$/ft. trunk), Tree Trunk Area (sq. in.), Trunk Area Increase/Clear Trunk Height Increase, Basic Tree Cost, Appraised Tree Value, Key Sheet #, Notes. The table lists 483 individual trees with their respective details.

- Notes:
1. **REPLC Category 3 invasive/exotic species not commercially available**
 2. Plant costs based on average price of largest commonly available plant size
 3. Where species was not commercially available, size and price were estimated based on similar species that were commercially available
 4. Species ratings are based on latest Florida DA Species Rating (2016); species were typically assigned a species rating at the lower end of the recommended range to provide a conservative value estimate (<http://www.floridada.org/jsf/2016/02/species%20rating%20final.pdf>)
 5. All trees were assigned a location rating of 75%; this was done in lieu of generating individual location scores for over 10k trees which was deemed impractical and was not anticipated to result in significant changes to the overall value of the trees.

Notes:

Therefore, a growth factor of 2.0 was universally applied to the dicot trees in the Delray Beach inventory

Trees are generally aged by multiplying "growth factors" by the trunk diameter. However, published growth factors for south Florida trees are generally unavailable.

When growth factors are not available, it is recommended that a factor of "4" be applied. However, trees in urban settings generally display significantly slower growth rates than trees in rural or open space settings.
